Minimum

```
entry: NXDetector
```

```
data[NP,xsize,ysize], signal=1 (1)
further detetcor parameters, using NeXus names where possible
```

- Programming model:
 - Dectris writes frames in HDF-5
 - Institute DAQ writes metadata, creates structures
 - Links internally or externally to detector data
- Performance: near raw disk I/O when using large chunks

More

```
entry: NX entry instrument: NX instrument detector: NX detector data [NP, xsize, ysize], signal = 1 (1) further detector parameters, using NeXus names when the signal is not signal in the signal in the signal is not signal in the signal in the signal in the signal is not signal in the signal in
```

More Wishes

- Diamond: data[nx,ny,xdim,ydim] for 2D scans
- APS: Rather a library then Camserver
- APS: latency of writing/reading file to much
